## GREAT SALT LAKE WETLANDS PROJECT, PHASE IV

The Great Salt Lake and associated wetlands support some four million waterfowl and five million shorebirds annually and form one of the most important wetland complexes in North America. While most of these birds are staging migrants, many breeding birds also occur there in high numbers. In Phase IV of Ducks Unlimited's long-term effort to conserve wetlands and migratory bird populations in the Great Salt Lake ecosystem, partners will focus on acquiring, restoring and enhancing wetlands and uplands immediately adjacent to the lake.

The project will protect, restore or enhance 12,410 acres of wetlands and associated uplands, 116 acres of which will be permanently protected. Work will occur on nine tracts, including four state waterfowl management areas, a national wildlife refuge and four private properties. Project work will benefit a quarter of the continental northern pintail population, nearly three quarters of the western tundra swan population, more than half of the western snowy plover population, the world's largest breeding populations of white-faced ibis and California gulls, one of the largest concentrations of breeding redheads in North America, the most important cinnamon teal breeding area in North America, and the world's largest staging concentration of Wilson's phalaropes.
